For the Impact Frame, we suggest use of the Option 1 security screw downs. Although our super strong spring loaded FlipUp frame edge will hold the Polycarbonate in place during attacks to it, we offer the additional option to add the screw downs. These screw downs hold the frame edges down such that the top cannot be flipped up to remove the Polycarbonate lens without removing the screws. We offer either PIN in TORX security screws that require a special tool to remove the screw (for highest antitamper) or regular Phillips head screws. The screws would be color matched to your frame to make them as low key as possible. These screws are added every 24-36 inches on all 4 frame sides. So, depending on your frame size, there will be 1-3 screw downs on each of the 4 frame sides.

These are the default supplied screws, PIN in TORX. Need special L key to remove the screws. (We can also supply regular non-security Phillips head or other types instead of these)

Pin in TORX security screw

L Key to remove TORX security screws. Hand operated.
